ISO 9001:2015 Certified E- Learning Platform by Learn More Pro Certificate Number : SQ21T01

CERTIFICATE

of Course Completion

This is to certify that

Nisha Nimai Haldar

Has Successfully Completed The E-Learning Course Of

30-Days SQL Micro Course

On **March 12, 2026**

Instructor : Satish Dhawale

Stick Your Passport Size Photo Here

Student Signature

Satish Dhawale
Director of CoursePe

This certificate is self learning certificate provided by Skill Course E-Learning Platform by Learn More Pro | Email :learnmoreprohelp@gmail.com
Website : https://skillcourse.in Address:402, A-Wing, Marathon Building, Karve Nagar, Kanjurmarg - East , Mumbai - 400042

SQL Assignment Questions

- ***What is SQL?***

SQL (Structured Query Language) is used to store, retrieve, manage, and manipulate data in relational databases.

- ***What is a database?***

A database is an organized collection of structured information or data.

- ***What is a table?***

A table is a structure in a database that stores data in rows and columns.

- ***What is a primary key?***

A primary key uniquely identifies each record in a table and cannot contain NULL or duplicate values.

- ***What is a foreign key?***

A foreign key links two tables together and references the primary key of another table.

- ***What is a candidate key?***

A candidate key is a column that can qualify as a unique key in the table.

- ***What is a composite key?***

A composite key is a key made up of two or more columns to uniquely identify a record.

- ***What is normalization?***

Normalization organizes data to reduce redundancy and improve data integrity.

- ***What is denormalization?***

Denormalization combines tables to improve read performance.

- ***What is a view?***

A view is a virtual table based on the result of an SQL query.

- ***What is an index?***

An index improves the speed of data retrieval operations on a table.

- ***What is a clustered index?***

A clustered index sorts and stores the data rows in the table based on the key.

- ***What is a non■clustered index?***

A non■clustered index stores a pointer to the data rather than the data itself.

- ***What is a JOIN?***

A JOIN combines rows from two or more tables based on a related column.

- ***Types of JOINs***

INNER JOIN, LEFT JOIN, RIGHT JOIN, FULL JOIN.

- ***What does INNER JOIN do?***

Returns records that have matching values in both tables.

- ***What does LEFT JOIN do?***

Returns all rows from the left table and matching rows from the right table.

- ***What does RIGHT JOIN do?***

Returns all rows from the right table and matching rows from the left table.

- ***What does FULL JOIN do?***

Returns all records when there is a match in either table.

- ***What is GROUP BY?***

GROUP BY groups rows that have the same values.

- ***What is HAVING?***

HAVING filters groups after GROUP BY is applied.

- ***Difference between WHERE and HAVING***

WHERE filters rows before grouping; HAVING filters after grouping.

- ***What is a subquery?***

A subquery is a query inside another SQL query.

- ***What is a correlated subquery?***

A subquery that depends on the outer query.

- ***What is a stored procedure?***

A stored procedure is a precompiled collection of SQL statements.

- ***What is a trigger?***

A trigger automatically executes when a specified database event occurs.

- ***What is a constraint?***

Rules applied to columns to enforce data integrity.

- ***Types of constraints***

PRIMARY KEY, FOREIGN KEY, UNIQUE, NOT NULL, CHECK, DEFAULT.

- ***What is DISTINCT?***

DISTINCT removes duplicate records from query results.

- ***What is ORDER BY?***

ORDER BY sorts the result set in ascending or descending order.

- ***What is LIMIT?***

LIMIT restricts the number of rows returned.

- ***What is OFFSET?***

OFFSET skips a specified number of rows before returning results.

- ***What is UNION?***

UNION combines the result of two queries and removes duplicates.

- ***What is UNION ALL?***

UNION ALL combines results but keeps duplicates.

- ***What is a transaction?***

A transaction is a sequence of operations treated as a single unit.

- ***What are ACID properties?***

Atomicity, Consistency, Isolation, Durability.

- ***What is COMMIT?***

COMMIT saves all changes made in the transaction.

- ***What is ROLLBACK?***

ROLLBACK undoes changes made in the transaction.

- ***What is TRUNCATE?***

TRUNCATE removes all rows from a table quickly.

- ***Difference between DELETE and TRUNCATE***

DELETE removes rows with condition; TRUNCATE removes all rows and resets identity.

- ***What is ALTER TABLE?***

ALTER TABLE modifies an existing table structure.

- ***What is DROP TABLE?***

DROP TABLE deletes the table structure and data permanently.

- ***What is CREATE TABLE?***

CREATE TABLE creates a new table in the database.

- ***What is INSERT?***

INSERT adds new records into a table.

- ***What is UPDATE?***

UPDATE modifies existing data in a table.

- ***What is DELETE?***

DELETE removes records from a table.

- ***Find duplicate records***

SELECT column, COUNT(*) FROM table GROUP BY column HAVING COUNT(*) > 1;

- ***Find 2nd highest salary***

SELECT salary FROM employees ORDER BY salary DESC LIMIT 1 OFFSET 1;

- ***Find employees above average salary***

SELECT * FROM employees WHERE salary > (SELECT AVG(salary) FROM employees);

- ***Find total number of employees***

SELECT COUNT(*) FROM employees;
